

CLAIMS

5 What is claimed is:

1. A mapping and address system operating in a server device, said system comprising:
 - a) a request handler module configured to manage requests between the mapping and addressing system and at least one remote access device;
 - b) a global positioning system (GPS) bridging system operatively coupled to said request handler module, said GPS bridging system configured to translate latitude and longitude data into street address data; and
 - c) a mapping system operatively coupled to said request handler module, said mapping system configured to provide graphical map data for street address data.
2. The mapping and address system of claim 1, wherein said mapping system is further configured to provide driving directions from a source address location to a destination address location.
3. The mapping and address system of claim 1, further comprising a remote access system operatively coupled to said request handler, said remote access system configured to communicate data with a base device via requests initiated by said base device.
